Energy Drinks May Cause Heart Problems in Some

Research seems to show that energy drinks can improve brain function and help you stay alert when you're tired.

However, there are also concerns that energy drinks have contributed to heart problems.

One review found that at least 17 people developed significant heart problems after energy drink use, which required them to visit the emergency room. Several of the people died from complications.

This is probably lower than the actual number of energy-drink-related heart problems, considering over 20,000 trips to the emergency department are associated with energy drink use every year in the US alone.

Furthermore, multiple studies in humans have also shown that consuming energy drinks may increase blood pressure and heart rate and decrease important markers of blood vessel function, which could be bad for heart health.

Most experts believe that heart problems associated with energy drink use occur as a result of excessive caffeine intake.

This seems reasonable, since many of the people who suffered serious heart problems after drinking energy drinks were consuming more than three energy drinks at a time or also mixing them with alcohol.

Although you may need to be cautious about using energy drinks if you have a history of heart disease, consuming them occasionally and in reasonable amounts is unlikely to cause heart problems in healthy adults with no history of heart disease.

Summary: *Several people have developed heart problems after consuming energy drinks, possibly due to drinking too much caffeine or mixing energy drinks with alcohol.*

Some Varieties Are Loaded With Sugar

Most energy drinks contain a sizable amount of sugar.

For example, one 8.4-ounce (250-ml) can of Red Bull contains 27 grams (about 7 teaspoons) of sugar, while a 16-ounce (473-ml) can of Monster contains about 54 grams (about 14 teaspoons) of sugar.

Consuming this much sugar will cause anyone's blood sugar to spike, but if you have difficulty controlling your blood sugar or have diabetes, you should be particularly cautious with energy drinks.

Consuming beverages sweetened with sugar, like most energy drinks, leads to blood sugar elevations that can be bad for health, especially if you have diabetes.

These blood sugar elevations have been associated with increased levels of oxidative stress and inflammation, which have been implicated in the development of nearly every chronic disease.

But even people without diabetes may need to be concerned about

the sugar in energy drinks. One study reported that drinking one or two sugar-sweetened beverages daily was correlated with a 26% higher risk of type 2 diabetes.

Luckily, many energy drink manufacturers are now making products that are either lower in sugar or have eliminated it altogether. These versions are more suitable for people with diabetes or those trying to follow a low-carb diet.

Summary: *Energy drinks can help people function while they're tired, but people may observe decreases in sleep quality following energy drink use.*

Should Anyone Drink Energy Drinks? How Much Is Too Much?

Most of the health concerns involving energy drinks center on their caffeine content.

Importantly, it is generally recommended that adults consume no more than 400 mg of caffeine per day.

Energy drinks typically only contain around 80 mg of caffeine per 8 ounces (237 ml), which is pretty close to an average cup of coffee.

The problem is that many energy drinks are sold in containers larger than 8 ounces (237 ml). Additionally, some contain more caffeine, especially "energy shots" like 5-Hour Energy, which has 200 mg of caffeine in only 1.93 ounces (57 ml).

On top of that, several energy drinks also contain herbal extracts like guarana, a natural source of caffeine that contains around 40 mg of caffeine per gram.

Energy drink manufacturers are not required to include this in the caffeine content listed on the product label, which means the total caffeine content of many beverages can be drastically underestimated.

Depending on the type and size of the energy drink you consume, it is not hard to exceed the recommended amount of caffeine if you consume multiple energy drinks in one day.

Although occasionally drinking one energy drink is unlikely to cause any harm, it is probably wise to avoid consuming energy drinks as a part of your daily routine.

If you decide to consume energy drinks, limit them to no more than 16 ounces (473 ml) of a standard energy drink per day and try to limit all other caffeinated beverages to avoid excessive intake of caffeine.

Are Energy Drinks Good or Bad for You?

Energy drinks are intended to boost your energy, alertness and concentration.

People of all ages consume them and they continue to grow in popularity.

But some health professionals have warned that energy drinks may have harmful consequences, which has led many people to question their safety.

This article weighs the good and the bad of energy drinks, providing an extensive review of their health effects.

What Are Energy Drinks?

Energy drinks are beverages that contain ingredients marketed to increase energy and mental performance.

Red Bull, 5-Hour Energy, Monster, AMP, Rockstar, NOS and Full Throttle are examples of popular energy drink products.

Nearly all energy drinks contain the ingredient caffeine to stimulate brain function and increase alertness and concentration.

However, the amount of caffeine differs from product to product. This table shows the caffeine content of some popular energy drinks:

	Product Size	Caffeine Content
• Red Bull	8.4 oz (250 ml)	80 mg
• AMP	16 oz (473 ml)	142 mg
• Monster	16 oz (473 ml)	160 mg
• Rockstar	16 oz (473 ml)	160 mg
• NOS	16 oz (473 ml)	160 mg
• Full Throttle	16 oz (473 ml)	160 mg
• 5-Hour Energy	1.93 oz (57 ml)	200 mg
•		

Energy drinks also typically contain several other ingredients. A few of the most common ingredients other than caffeine are listed below:

- Sugar: Usually the main source of calories in energy drinks, although some do not contain sugar and are low-carb friendly.
- B vitamins: Play an important role in converting the food you eat into energy your body can use.
- Amino acid derivatives: Examples are taurine and L-carnitine. Both are naturally produced by the body and have roles in several biological processes.
- Herbal extracts: Guarana is likely included to add more caffeine, while ginseng may have positive effects on brain function.

Summary: *Energy drinks are designed to increase energy and mental performance. They contain a combination of caffeine, sugar, vitamins, amino acid derivatives and herbal extracts.*

Energy Drinks Can Improve Brain Function

People consume energy drinks for a variety of reasons.

One of the most popular is to increase mental alertness by improving brain function.

But does research really show energy drinks can provide this benefit?

Multiple studies confirm that energy drinks can indeed improve measures of brain function like memory, concentration and reaction time, while also reducing mental fatigue.

In fact, one study, in particular, showed that drinking just one 8.4-ounce (500-ml) can of Red Bull increased both concentration and memory by about 24%.

Many researchers believe this increase in brain function can solely be attributed to caffeine, while others have speculated that the combination of caffeine and sugar in energy drinks is necessary to see the most benefit.

Summary: *Energy drinks can help people function while they're tired, but people may observe decreases in sleep quality following energy drink use.*
